Introduction

This project involved creating and configuring a Microsoft Azure Free Tier environment to gain practical exposure to cloud computing concepts. Activities included account setup, Azure Portal exploration, resource deployment, governance review, and cost management exploration.

Selected Azure Region

The selected deployment region was West Europe.

Reason for Selection

West Europe was chosen because it is geographically close to the deployment location, providing reduced network latency, improved performance, and reliable access to Azure services.

Resource Group Created

Resource Group Name: DevOps-Lab-RG

The Resource Group was created to logically organize and manage Azure resources used during the project.

Resource Deployed

Resource Type: Storage Account

The Storage Account was successfully deployed within the Resource Group. This deployment demonstrated the Azure resource provisioning process, validation workflow, and deployment monitoring features.

Understanding the Shared Responsibility Model

The Shared Responsibility Model defines security responsibilities between Microsoft Azure and the customer.

Microsoft's Responsibilities

- Physical security of data centers
- Network infrastructure
- Hardware maintenance
- Hypervisor and platform security
- Service availability

Customer Responsibilities

- User access management
- Password and identity security
- Data protection
- Resource configuration
- Monitoring and compliance settings

For the deployed Storage Account, Microsoft secures the underlying infrastructure, while the customer remains responsible for controlling access permissions and protecting stored data.

Cost Management Review

The Azure Cost Management and Billing section was accessed to review spending information, Cost Analysis tools, and budget configuration options. These tools help users remain within Free Tier limits and avoid unexpected charges.

Conclusion

This project provided practical experience with Microsoft Azure and strengthened understanding of cloud governance, resource management, identity management, deployment processes, and cost control practices.
